

HorizoN

LITE

New to the Afferent Software family, Horizon Lite offers users a modern, simple and intelligent way to configure typically complex aspects of their payments platforms such as ATMs and POS devices.

Horizon Lite is an intuitive and powerful configuration tool for payments systems, offering an alternative system to the current limited and problematic options. This product allows users to configure most elements of their system through a modern, easy-to-use Graphical User Interface (GUI).

The GUI is powered by intelligent scripts that define the available configuration options. Customisable configuration rules and submissions along with management approval processes are key features packed into this solution. These features, among others, help to minimise production errors and allow for greater productivity.
